FOR IMMEDIATE RELEASE

CRAZYPIXELS RELEASES – CAMDVR (Digital Video Recorder)

March 2014, CrazyPixels releases CamDVR, Software that will change the surveillance market.

CamDVR is a powerful software solution for all video devices, like IP-Cams, Web cams, capture cards and much more. The program supports an unlimited number of video devices and is capable of recording, live broadcasting over the Internet, doing unlimited surveillance and scheduler tasks. The (motion) detector performs image comparisons, face detection and other special tasks.
Using web cameras for surveillance and monitoring is growing more and more popular every year, especially among businesses and home owners. CamDVR turns your PC in a digital video recorder without the need of extra cost intensive hardware.
When the program detects motion, it can start one or several pre-adjusted functions. For instance video recording, image capturing, executing specified applications, sounding an alarm, transmitting http commands, uploading files to a web server or notifying a camera owner with an email, among other things. The log of all events is being kept as well.
CamDVR highly uses parallel processing to work with all cameras and all functions simultaneously.

The program comes also with a function rich scheduler, so all tasks can be programmed in advance. In addition, CamDVR can be set up to monitor only certain areas for motion during specified days or time intervals. The huge repertoire of functions and the low price of CamDVR makes it an ideal solution for all people who wants to own and use a DVR-System (Digital Video Recording).

The outstanding features of CamDVR are the permanent video recording and the pre-recorded videos. With the permanent recording feature the software records 24/7 all the activities going on and makes a surveillance system complete. Additional CamDVR is capable to pre-record hidden in the background from each camera, so that in case of a detection this pre-recorded video could be used.

Additional CamDVR comes with an integrated Web server. With a simple HTTP request, all camera videos are viewable in the Web browser over the LAN or the Internet.

A short feature overview:

a. support of various types of video devices, like Web cams, IP-Cams, network cameras, capture cards, video files, DVDs, streams, etc.
b. support of various transfer protocol types and codecs
c. integrated (motion) detector with several detection modes, like image comparison, face detection, miscellaneous types
d. integrated scheduler for unlimited video tasks
e. various different executable functions at detection and by scheduler
f. integrated multiple Email- and FTP-clients and a Web-Server
g. integrated Video-Network Server+Client
h. standard functionality like picture capturing, video recording, video previewing, etc.
i. various image filters like black&white, grey scale, brightness, colorize, contrast, edge detection, pixel-late, noise reduction, normalize and more
j. permanent video recording in preselected video file sizes for 24/7 usage
k. the detector supports pre-recorded videos to use in case of detection
l. highly use of multiple cores CPUs (parallel processing)

CamDVR is distributed electronically over the Internet. A free trial version is available at http://www.crazypixels.com for evaluation. The price of a single copy is 159.95 US Dollars.

CrazyPixels is a software company based in Berlin, Germany, and specializing in digital video solutions. Besides CamDVR, the company developed and actively markets CamUniversal, CamPermanent, CamSurveillance and CamLAN.

If you've been seeking a reliable, powerful and affordable digital video monitoring tool for your office, warehouse or home, don't lose this chance to try out one of the best programs of its kind on the market!
